

Yaesu FT-847 "MEM/VFO CH" Rotary Encoder Repair – February 15, 2024

REF.	Description	YAESU P/N	Qty.
①	PAN HEAD SCREW M2.6x6	U00206001	4
②	PAN HEAD SCREW M3x8	U00308001	14
③	PAN HEAD SCREW M3x30	U00330001	4
④	PAN HEAD SCREW M4x6B	U00406007	2
⑤	SEMS SCREW ASM3x6	U03306001	8
⑥	BINDING HEAD SCREW M2x4B	U20104007	1
⑦	BINDING HEAD SCREW M3x6	U20306001	3
⑧	TAPTITE SCREW M3x6	U24306001	63
⑨	TAPTITE SCREW M3x8	U24308001	9
⑩	OVAL HEAD SCREW M4x6B	U31406007	2
⑪	OVAL HEAD SCREW M4x10B	U31410007	4
⑫	OVAL HEAD SCREW M4x16B	U31416007	2
⑬	TAPTITE SCREW M3x6	U34306001	4
⑭	TAPTITE SCREW M3x6	U44306001	8
⑮	TOOTHED LOCK WASHER OW4NI	U72004002	1
⑯	HEX HEAD BOLT HSM4x16NI	U9900076	1
⑰	BINDING HEAD SCREW M3x18	U20318001	1
⑱	BINDING HEAD SCREW M3x20NI (Lot. 8~)	U20320002	4

1-Remove the following screws in this order (see above table): #11, #12, #13, #7

2-Remove Main Knob set screw: Metric #1.5

3-Remove screw #6

3-Some controls are fixed with a HEX nut & Washer to be removed after the face plate is removed.

4-All other knobs simply pull off their shafts

First pull off all the knobs (except for the Main Knob). The main Knob can be removed with metric Allen Key #1.5 , then remove screw #6 which hold the face plate to the metal frame of the front panel.

Removing screws #11, #12 and #13 allows you to remove the top and bottom covers and rotate the front panel assembly as shown below. Now pry off the wiring connectors that attach the panel to the radio body. You will be able to get most of the connectors disconnected but not all. However you will be able to pivot the panel.

It's recommended that you take a picture of the back of the front panel in order to serve as a reference of which connector goes to which receptacle.

One knob was found to be glued on (in my rig) so to remove it required the area around the knob to be masked off with aluminum tape and the knob was heated (GENTLY and CAUTIOUSLY) with a solder re-work heat gun. Then immediately wrapped with double sided sticky tape and yanked on (big time) and it came off...!

*This method was recommended by VE6OB....

After laying the panel flat, remove the HEX nuts holding controls to the metal front panel frame

HEX nuts on controls

Unsolder the Rotary Encoder and then pull (GENTLY) the front panel circuit board back from it's metal frame. (JUST ENOUGH TO REPLACE THE ENCODER)

AFTER replacing the Encoder then re-install all controls HEX nuts thus ensuring the circuit board is seated properly in the metal frame AND THEN **solder the Rotary Encoders tabs!**....(4 contacts and 2 mounting posts associated with the Encoder)

Old defective Rotary Encoder removed.

NEW Rotary Encoder installed

Re-Assembly is simply the reverse of Dis-Assembly
